23rd November 2015

Overview

- Context of the investigation: risk theory
- Data and research questions
- Linguistic approaches to risk
- Our methods and linguistic findings
- Sociological significance of the results

This slideshow is available at: http://git.io/vBfbw

The project(s)

I'm presenting work from closely related projects:

- Risk words in the NYT, 1963, 1987–2014
- Risk words in NYT health articles
- 3 Risk words in six US newspapers, 1987–2014

All investigations involve making longitudinally structured, parsed corpora and looking at how risk words behave.

Context: sociological risk theory

From previous sociological and linguistic research, we know that:

- Risk as concept is sociologically important
 - ▶ New global risks (Beck, 1992)
 - ► Calculative technologies (Dean, 1999)
 - ▶ Individualisation (Beck) and Technologies of the Self (Dean, 1998)
 - ▶ Risk-taking (Luhmann, 1993)
- Risk as lexical item is increasingly frequent in print journalism (Zinn 2011)
- Risk as a lexical item in naturalistic text may behave contrary to expectations (Hamilton, Adolphs, & Nerlich, 2007)

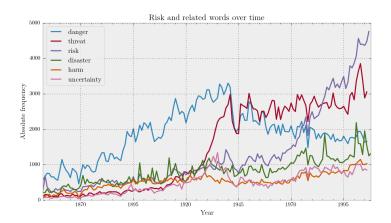

The data

- NYT Annotated Corpus: 1.8 million articles, 1987–2007 (Sandhaus, 2008)
- ProQuest Newsstand for NYT 2007–2014
- Or ProQuest Newsstand for five other newspapers, 1987–2014
 - Washington Post
 - 2 Tampa Bay Times
 - **3** USA Today
 - Ohicago Tribune
 - **6** Wall Street Journal

Increasing frequency of risk lemma

Research questions

- What are risk words doing in the NYT?
- How has the behaviour of risk words changed in the NYT between 1963 and 2014?
- Can we connect these findings to sociological theories of risk?
- What kinds of tools and methods can we use/develop to do this kind of research?

New methodologies

New kinds of data and tools make it possible to empirically analyse risk language in new ways:

- Digitisation of newspapers means we have large, well-structured datasets
- Parsing makes it possible to search for lexical and grammatical features in tandem
- Programmatic approaches to social science research facilitate:
 - ► Automation
 - Reproducibility
 - ► Transparency
 - ▶ Ability to deploy methods on new data
 - ► Objectivity?

Frame semantic approach

Frame semantics: risk as a cognitive schema (Fillmore & Atkins, 1992)

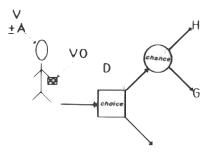

- Conceptualises risk mostly as experiential Process/Event
 - ▶ What kind of participants and circumstances occur when risk is the Process?
- Problem: risk often takes less prominent experiential roles
 - ▶ Is the risk frame actually invoked when the word is used?
 - ► Example:

Mr. Tepfer noted that Mr. Douglas, who was in the neighborhood when the body was found and was interviewed by the police at the time, 'preyed on at-risk women, on prostitutes, and he engaged in sex and strangled them to death.'

The risk frame

$$\label{eq:hamman} \begin{array}{ll} H = \mbox{Harm, } G = \mbox{Goal,} \\ D = \mbox{Deed, } VO = \mbox{Valued Object,} \\ V = \mbox{Victim, } A = \mbox{Actor.} \end{array}$$

Corpus linguistic approach

Corpus linguistics: risk as token (Hamilton et al., 2007)

- Topics and text-types in which risk tokens appear
- Collocates of risk tokens
- Risk appears a lot in discussions of health
- Use of risk words is different to invented examples

Shortcomings:

- Smaller corpus size, heterogeneity of samples
- No parsing, lemmatisation
- No systematic connection of lexicogrammatical patterns to discourse/meaning

Our methods

- Get all paragraphs containing \brisk in all 1987-mid 2014 articles
- Annotate/parse the data with full Stanford CoreNLP suite
- Develop corpkit, a toolkit for searching the corpus and communicating results
- Interrogate the corpus according to notions from systemic functional grammar
- Connect to sociological theory

SFL: Introduction

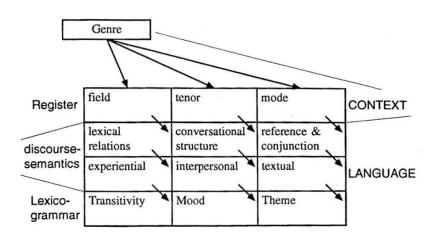

- Systemic: focus on relationships between signs in the sign-system
- Functional: focus on language as a tool for the performance of functions
 - Interpersonal: negotiating relationships
 - 2 Experiential: representing the world
 - Textual: reflexive organisation into meaninful sequences

In general, print news in a single publication is fairly stable in terms of interpersonal and textual features.

Overview of SFL

Transitivity system

- Focus on the clause as a unit of analysis
- Centre on the *process* (i.e. rightmost verb in VP)
- Processes *select* participants (i.e. arguments of the verb)
- PPs and RBs are typically *circumstances*

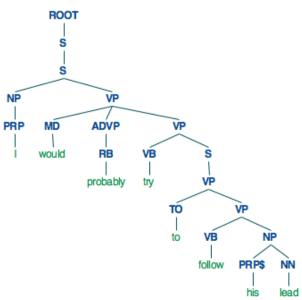

SF transitivity analysis

	But	the bang of the gavel	$can\ hold$	risk	for novices
ſ		Participant:	Process:	Participant:	Circumstance:
İ		Carrier	Relational	Attribute	Extent
			attributive		

Constituency grammar

Dependency grammar

The controversial question

The question: Can we get systemic functional information from constituency and dependency parses?

The answer: Yep, quite a lot.

Developing tools

How to investigate this huge dataset, and make the investigation transparent/reproducible?

- corpkit: a Python module designed for parsed and structured corpora
 - ▶ interrogator(): search for lexicogrammatical phenomena in each subcorpus, tally results, output Pandas objects
 - ▶ editor(): edit results, calculate keyness, linear regression
 - ▶ plotter(): visualise via matplotlib
 - ▶ conc(): concordance via parses
- Sciptable, multiprocessing, handles arbitrary data, open-source
- Systemic-functionally aware
- More recently, a GUI, aimed at corpus linguists

corpkit: plotting

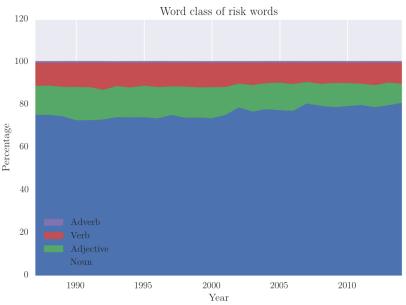

corpkit: Example code

```
# import module and set data path
>>> from corpkit import *
>>> corpus = 'data/NYT-parsed'
# get pos of risk words, show word class
>>> res = interrogator(corpus, 'words', r'\brisk',
       show = ['p'], lemmatise = True)
# get relative frequency
>>> rel = editor(res.results, '%', res.totals, keep_top = 4)
# visualise
>>> plotter('Word class of risk words', rel.results,
... kind = 'area', style = 'seaborn-talk')
```

Example output

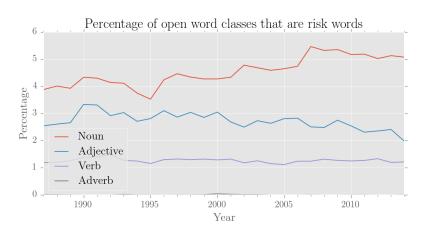

Initial investigation: NYT

Our first investigation was of the NYT only

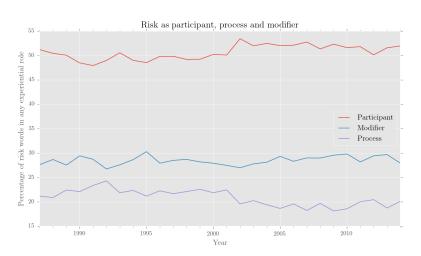

Nominalisation of risk

Experiential roles of risk words

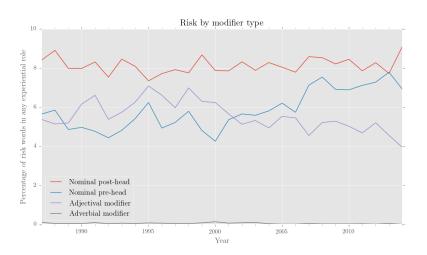

They risked their life \rightarrow It was a risk

Risk as modifier

 $Risky\ decision
ightarrow risk\ assessment$

Risk and power

 \rightarrow Powerful and influential people do risking

Distance of risk word from root

 \rightarrow looked promising, but seems to be a general phenomenon.

Mood role of risk words (NYT)

Arguable \rightarrow inarguable

First investigation: key findings

- Nominalisation and participantification
 - ightharpoonup risk assessment
 - ▶ Meaning of risk expanding beyond the *risk frame*
- Risk words becoming more implicit
 - Routinisation of the management of risk
 - ▶ Risk as increasingly present, but decreasingly debated
- More everyday exposure to risk, but less risking
 - ▶ Neoliberal conceptualisations of agency: institutional expectation to take risk
 - ▶ Reporting of 'the scandal of not being in control' (Beck, 1992)

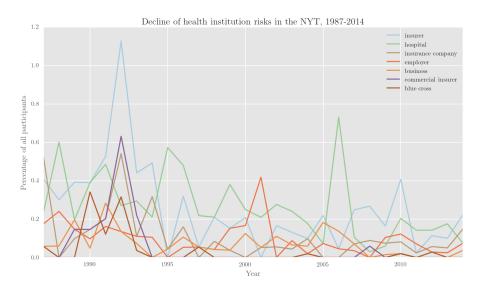

Health risk

- As earlier studies have shown, risk words often occur in health domains.
- The NYT Annotated Corpus had some manually added topic tags
- We created a subcorpus of health articles

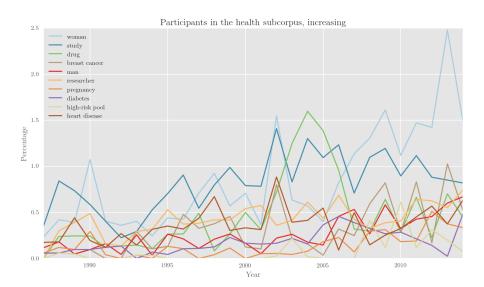

Decreasing participants in health discourse

Increasing participants in health discourse

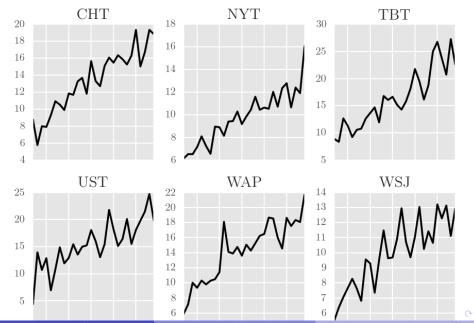

Six newspapers

- We've only just started interrogating the six newspaper corpus
- First, we'd like to check if the NYT findings are generalisable to other publications.
- Then, understanding the reason for differences and similarities would be nice
- Would love help on dealing with the complexity of the data structure!

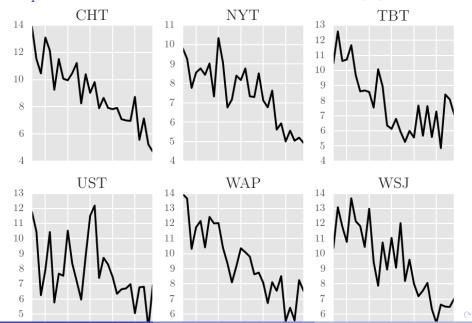

To take risk

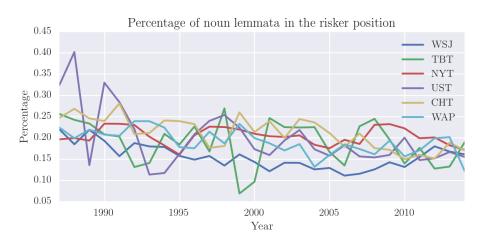

To put at risk

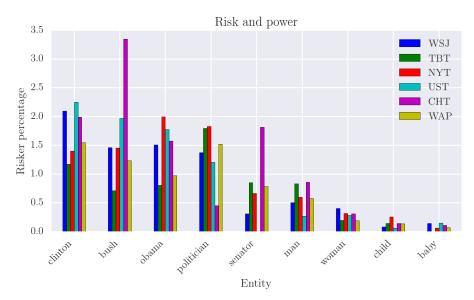

Less risking

Risk and power across publications

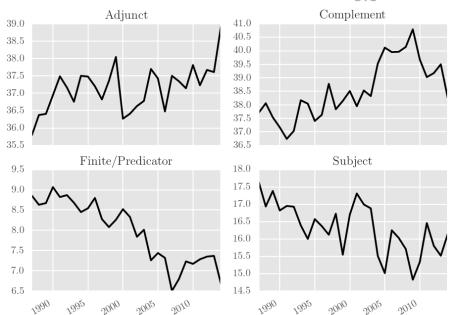

Mood role of risk words

42 / 48

Preliminary findings

- Many phenomena generalisable
- Some newspaper specific constructions: risk appetite in the WSJ
- Fewer grammatical riskers, but risk characterising more participants and processes
- Hints of influence of newspaper's politican position

Discussion of methodology

- SFL proves a useful means of dividing up and investigating the behaviour of a given word
- Systemic categories are often more telling than formal/constituency/dependency labels
- SFL parsing is difficult, as is converting concepts from (esp. formal) grammars
- Difficult SF concepts: rank shift, grammatical metaphor, appraisal, process types (Yan, 2014; Costetchi, 2013; Heyvaert, 2003)
- That said, though theoretical orientations are different, much of the grammar (esp. at group/phrase levels) are similar

Limitations

- This is a study of risk words, not risk
- Congruent realisations are analysed at the expense of the incongruent
- Little concordancing, close reading of individual texts
- Difficulty translating between grammars
- Parser accuracy
- Lack of reference corpus to compare related words/general language

It's all open source

Data and tools are available for reuse:

- https://www.github.com/interrogator/risk
- https://www.github.com/interrogator/corpkit

Findings are presented dynamically in an Jupyter Notebook:
