## Shifting discourse-semantics of risk in US newspapers, 1987–2014

Daniel McDonald Jens Zinn

@interro\_gator

This slideshow is available at: http://git.io/vBfbw

23rd November 2015

#### Overview

- Context of the investigation: risk theory
- Data and research questions
- Linguistic approaches to risk
- Our methods and linguistic findings
- Sociological significance of the results

This slideshow is available at: http://git.io/vBfbw

## The project(s)

I'm presenting work from closely related projects:

- Risk words in the NYT, 1963, 1987–2014
- Risk words in NYT health articles
- 3 Risk words in six US newspapers, 1987–2014

All investigations involve making longitudinally structured, parsed corpora and looking at how risk words behave.

## Context: sociological risk theory

Risk as concept is sociologically important:

- New global risks (Beck, 1992)
- Calculative technologies (Dean, 1999)
- Individualisation (Tradition to decision)
- Technologies of the Self (Dean, 1998)
- Risk-taking (Luhmann, 1993)

#### Context: risk as word

- Risk can be nominal, verbal, adjectival, adverbial
- Risk as lexical item is increasingly frequent in print journalism (Zinn 2011)
- Risk as a lexical item in naturalistic text may behave contrary to expectations (Hamilton, Adolphs, & Nerlich, 2007)
- Meaning of risk moves toward threat/danger

Risk as participant is more closely related to negative outcomes than risk as process:

- They risked it all and won
- Risks/rewards

## Context: new methodologies

New kinds of data and tools make it possible to empirically analyse risk language in new ways:

- Digitisation of newspapers means we have large, well-structured datasets
- Parsing makes it possible to search for lexical and grammatical features in tandem
- Programmatic approaches to social science research facilitate:
  - ▶ Automation
  - Reproducibility
  - Transparency
  - ▶ Ability to deploy methods on new data
  - ► Objectivity?

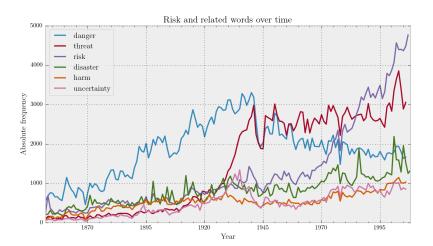

#### The data

- NYT Annotated Corpus: 1.8 million articles, 1987–2007 (Sandhaus, 2008)
- 2 ProQuest Newsstand for NYT 2007–2014
- Or ProQuest Newsstand for five other newspapers, 1987–2014
  - Washington Post
  - 2 Tampa Bay Times
  - **3** USA Today
  - Chicago Tribune
  - **6** Wall Street Journal
- **9** 54,288,152 words
- **1**,031,208 risk words
- 43GB when parsed

# Increasing frequency of risk lemma

### Research questions

We span the sociological, linguistic and computational:

- How does the institutionalisation of new societal practices manifest linguistically in the change of risk discourses and the use of risk language?
- ② How do risk words behave longitudinally at the lexicogrammatical and discourse-semantic strata?
- What kinds of tools or methods are needed for this kind of (digital humanities) research?

## Linguistics: frame semantic approach

Frame semantics: risk as a cognitive schema (Fillmore & Atkins, 1992)

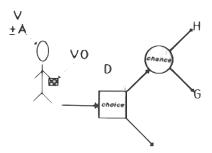

- Conceptualises risk mostly as experiential Process/Event
  - ▶ What kind of participants and circumstances occur when risk is the Process?
- Problem: risk often takes less prominent experiential roles
  - ▶ Is the risk frame actually invoked when the word is used?
  - ► Example:

Mr. Tepfer noted that Mr. Douglas, who was in the neighborhood when the body was found and was interviewed by the police at the time, 'preyed on at-risk women, on prostitutes, and he engaged in sex and strangled them to death.'

#### The risk frame

$$\begin{array}{c} H = Harm, \, G = Goal, \\ D = Deed, \, VO = Valued \, Object, \\ V = Victim, \, A = Actor. \end{array}$$

## Corpus linguistic approach

#### Corpus linguistics: risk as token (Hamilton et al., 2007)

- Topics and text-types in which risk tokens appear
- Collocates of risk tokens
- Risk appears a lot in discussions of health
- Use of risk words is different to invented examples

#### Shortcomings:

- Smaller corpus size, heterogeneity of samples
- No parsing, lemmatisation
- No systematic connection of lexicogrammatical patterns to discourse/meaning

#### Our methods

- Get all paragraphs containing \brisk in all 1987-mid 2014 articles
- Annotate/parse the data with full *Stanford CoreNLP* suite with embarrassingly parallel HPC
- Develop corpkit, a toolkit for searching the corpus and communicating results
- Interrogate the corpus according to notions from systemic functional grammar
- Connect to sociological theory

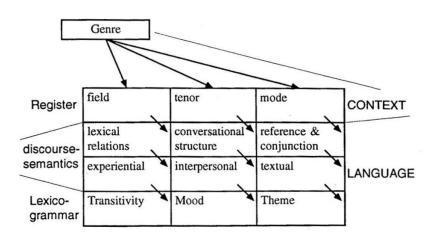

#### SFL: the basics

- Systemic: lexis as delicate grammar
- Functional: focus on language as a tool for the performance of functions
  - Interpersonal: negotiating relationships
  - 2 Experiential: representing the world
  - **3** Textual: reflexive organisation into meaninful sequences

#### Overview of SFL

### Transitivity system

- Focus on the clause as a unit of analysis
- Centre on the *process* (i.e. rightmost verb in VP)
- Processes *select* participants (i.e. arguments of the verb)
- PPs and RBs are typically *circumstances*

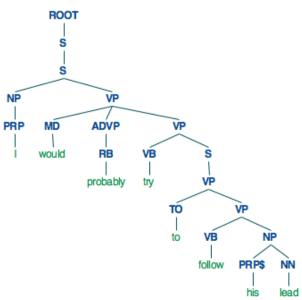

## SF transitivity analysis

But	the bang of the gavel	$can\ hold$	risk	for novices
	Participant:	Process:	Participant:	Circumstance:
	Carrier	Relational	Attribute	Extent
		attributive		

### Constituency grammar

### Dependency grammar

# The controversial question

The question: Can we get systemic functional information from constituency and dependency parses?

The answer: Yep, quite a lot.

## Developing tools

How to investigate this huge dataset, and make the investigation transparent/reproducible?

- corpkit: a Python module designed for parsed and structured corpora
  - ▶ interrogator(): search for lexicogrammatical phenomena in each subcorpus, tally results, output Pandas objects
  - ▶ editor(): edit results, calculate keyness, linear regression
  - ▶ plotter(): visualise via matplotlib
  - conc(): concordance via parses
- Scriptable, multiprocessing, handles arbitrary data, open-source
- Systemic-functionally aware
- More recently, a GUI, aimed at corpus linguists

### corpkit: plotting

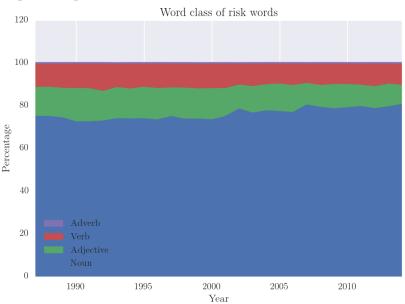

### corpkit: example code

```
# import module and set data path
>>> from corpkit import *
>>> corpus = 'data/NYT-parsed'
# get pos of risk words, show word class
>>> res = interrogator(corpus, 'words', r'\brisk',
       show = ['p'], lemmatise = True)
# get relative frequency
>>> rel = editor(res.results, '%', res.totals, keep_top = 4)
# visualise
>>> plotter('Word class of risk words', rel.results,
... kind = 'area', style = 'seaborn-talk')
```

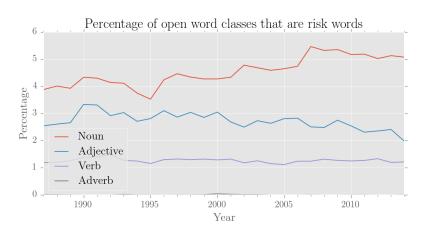

## Example output

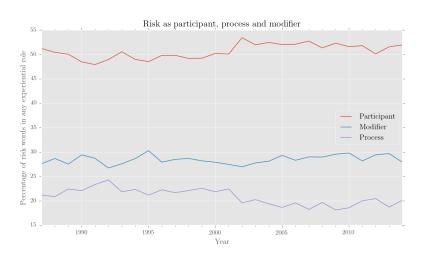

#### Nominalisation of risk in the NYT

# Experiential roles of risk words

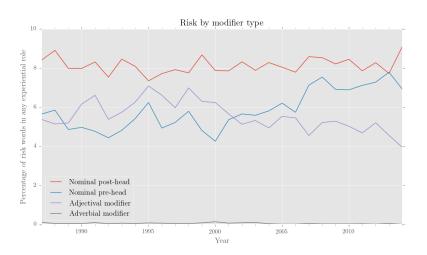

They risked their life  $\rightarrow$  It was a risk

### Risk as modifier

 $Risky\ decision 
ightarrow risk\ assessment$ 

## Risk and power

 $\rightarrow$  Powerful and influential people do risking

### Distance of risk word from root

 $\rightarrow$  looked promising, but seems to be a general phenomenon.

# Mood role of risk words (NYT)

Arguable  $\rightarrow$  inarguable

# First investigation: key findings

- Nominalisation and participantification: synonymy of risk and negative outcome
  - ightharpoonup risk assessment
  - ▶ Meaning of risk expanding beyond the *risk frame*
- Risk words becoming more implicit
  - Routinisation of the management of risk
  - Risk as increasingly present, but decreasingly debated
- More everyday exposure to risk, but less risking
- Neoliberal conceptualisations of agency: institutional expectation to take risk, absolution of responsibility for institutions themselves

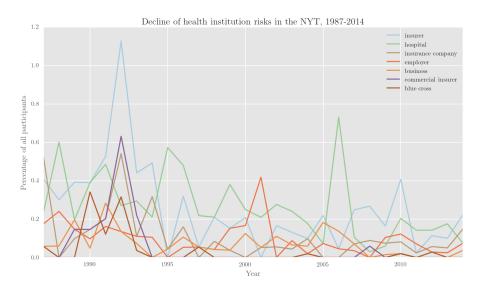

#### Health risk

- As earlier studies have shown, risk words often occur in health domains.
- The NYT Annotated Corpus had some manually added topic tags
- We created a subcorpus of health articles

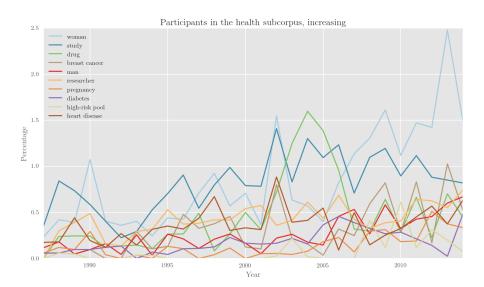

# Decreasing participants in health discourse

## Increasing participants in health discourse

### Six newspapers

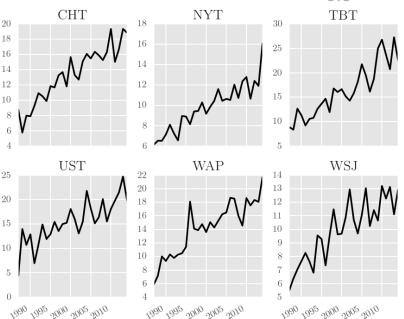

- We've only just started interrogating the six newspaper corpus
- First, we'd like to check if the NYT findings are generalisable to other publications.
- Then, understanding the reason for differences and similarities would be nice
- Would love help on dealing with the complexity of the data structure!

### To take risk

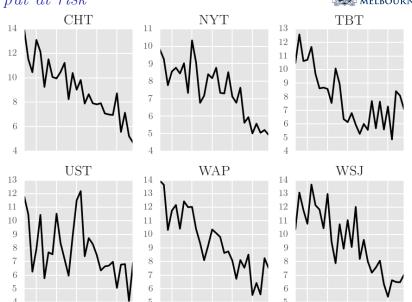

38 / 48

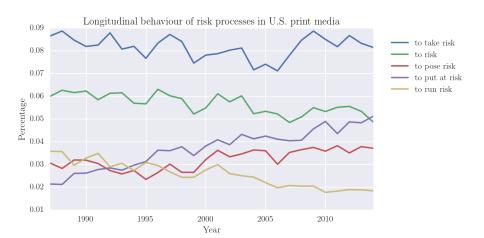

# To put at risk

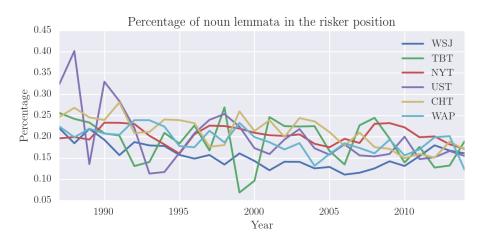

## Risk processes

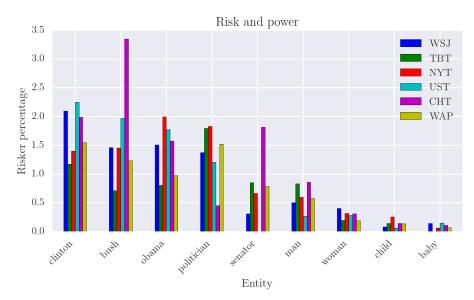

### Less risking

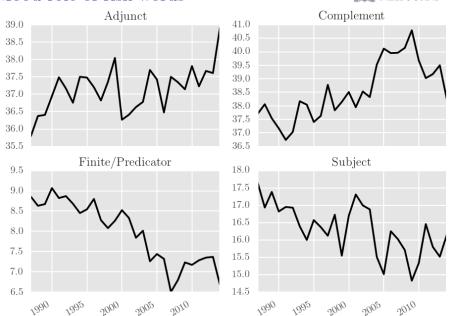

# Risk and power across publications

### Mood role of risk words

# Preliminary findings

- Many phenomena generalisable
- Some newspaper specific constructions: risk appetite in the WSJ
- Fewer grammatical riskers, but risk characterising more participants and processes
- Hints of influence of newspaper's politican position

# Discussion: using SFL

- SFL proves a useful means of dividing up and investigating the behaviour of a given word
- Systemic categories are sometimes more telling than formal/constituency/dependency labels
- Though theoretical orientations are different, much of the grammar (esp. at group/phrase levels) are actually very similar

#### Limitations

- This is a study of risk words, not risk
- Congruent realisations are analysed at the expense of the incongruent
- Little concordancing, close reading of individual texts
- Parser accuracy
- $\bullet$  Lack of reference corpus to compare related words/general language

# It's all open source

Data and tools are available for reuse:
